Lecture 18: Graphs

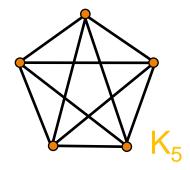

These are not Graphs

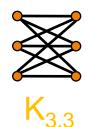

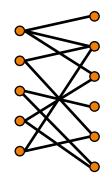

...not the kind we mean, anyway

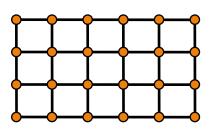

These are Graphs

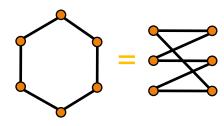

Applications of Graphs

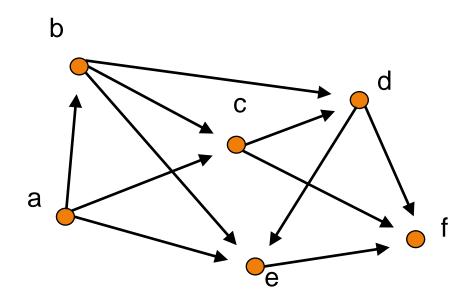

- Communication networks
- Routing and shortest path problems
- Commodity distribution (flow)
- Traffic control
- Resource allocation
- Geometric modeling

•

Graph Definitions

- A directed graph (or digraph) is a pair (V, E) where
 - V is a set
 - E is a set of ordered pairs (u,v) where $u,v \in V$
 - Usually require u ≠ v (i.e., no self-loops)
- An element of V is called a vertex or node
- An element of E is called an edge or arc
- |V| = size of V, often denoted n
- |E| = size of E, often denoted m

Example Directed Graph (Digraph)

$$V = \{a,b,c,d,e,f\}$$

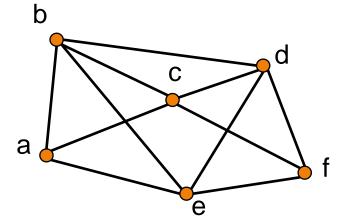

E = \{(a,b), (a,c), (a,e), (b,c), (b,d), (b,e), (c,d),
(c,f), (d,e), (d,f), (e,f)\}

$$|V| = 6$$
, $|E| = 11$

Example Undirected Graph

An *undirected graph* is just like a directed graph, except the edges are *unordered pairs* (*sets*) {u,v}

Example:

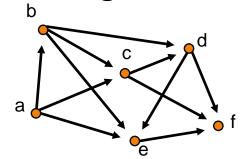

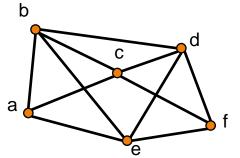

```
V = \{a,b,c,d,e,f\}

E = \{\{a,b\}, \{a,c\}, \{a,e\}, \{b,c\}, \{b,d\}, \{b,e\}, \{c,d\}, \{c,f\}, \{d,e\}, \{d,f\}, \{e,f\}\}
```

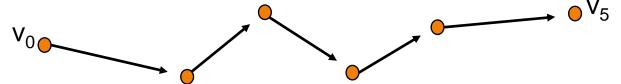

Some Graph Terminology

- Vertices u and v are called the source and sink of the directed edge (u,v), respectively
- Vertices u and v are called the endpoints of (u,v)
- Two vertices are adjacent if they are connected by an edge
- The outdegree of a vertex u in a directed graph is the number of edges for which u is the source
- The indegree of a vertex v in a directed graph is the number of edges for which v is the sink
- The degree of a vertex u in an undirected graph is the number of edges of which u is an endpoint

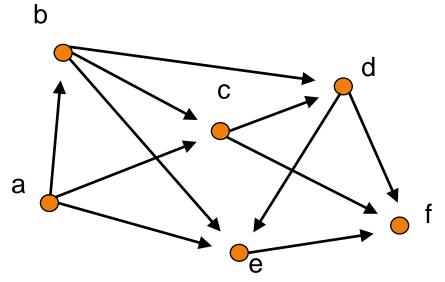

More Graph Terminology

- A path is a sequence $v_0, v_1, v_2, ..., v_p$ of vertices such that $(v_i, v_{i+1}) \in E, 0 \le i \le p-1$
- The length of a path is its number of edges
 - In this example, the length is 5
- A path is simple if it does not repeat any vertices
- A cycle is a path $v_0, v_1, v_2, ..., v_p$ such that $v_0 = v_p$
- A cycle is simple if it does not repeat any vertices except the first and last
- A graph is acyclic if it has no cycles
- A directed acyclic graph is called a dag

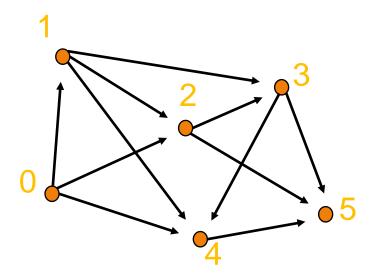

Is This a Dag?

- Intuition:
 - If it's a dag, there must be a vertex with indegree zero
- This idea leads to an algorithm
 - A digraph is a dag if and only if we can iteratively delete indegree-0 vertices until the graph disappears

Topological Sort

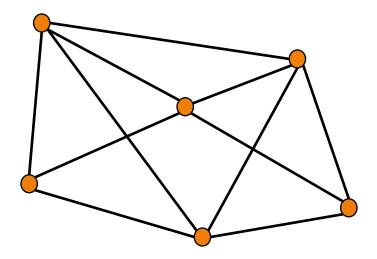

- We just computed a topological sort of the dag
 - This is a numbering of the vertices such that all edges go from lower- to higher-numbered vertices

Useful in job scheduling with precedence constraints

Graph Coloring

 A coloring of an undirected graph is an assignment of a color to each node such that no two adjacent vertices get the same color

How many colors are needed to color this graph?

Graph Coloring

 A coloring of an undirected graph is an assignment of a color to each node such that no two adjacent vertices get the same color

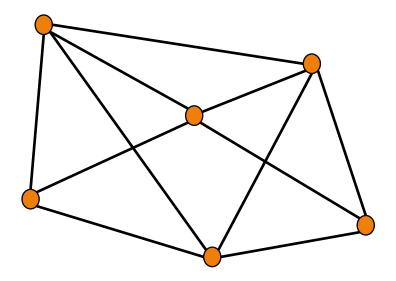

How many colors are needed to color this graph?

An Application of Coloring

- Vertices are jobs
- Edge (u,v) is present if jobs u and v each require access to the same shared resource, and thus cannot execute simultaneously
- Colors are time slots to schedule the jobs
- Minimum number of colors needed to color the graph = minimum number of time slots required

Planarity

 A graph is planar if it can be embedded in the plane with no edges crossing

Is this graph planar?

Planarity

 A graph is planar if it can be embedded in the plane with no edges crossing

- Is this graph planar?
 - Yes

Planarity

 A graph is planar if it can be embedded in the plane with no edges crossing

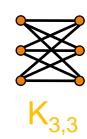

- Is this graph planar?
 - Yes

Detecting Planarity

Kuratowski's Theorem

• A graph is planar if and only if it does not contain a copy of K_5 or $K_{3,3}$ (possibly with other nodes along the edges shown)

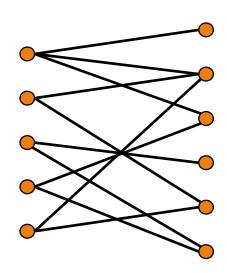

Four-Color Theorem: Every planar graph is 4-colorable.

(Appel & Haken, 1976)

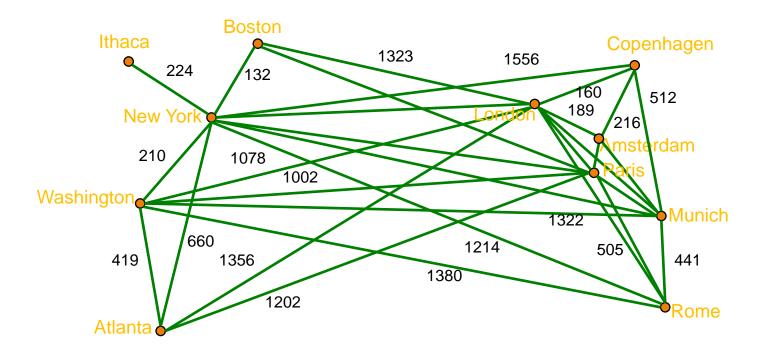

Bipartite Graphs

- A directed or undirected graph is bipartite if the vertices can be partitioned into two sets such that all edges go between the two sets
- The following are equivalent
 - G is bipartite
 - G is 2-colorable
 - G has no cycles of odd length

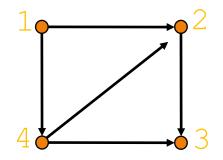

Traveling Salesperson

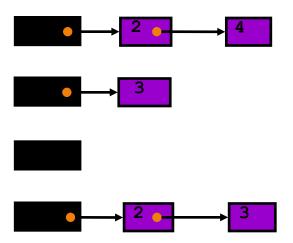

Find a path of minimum distance that visits every city

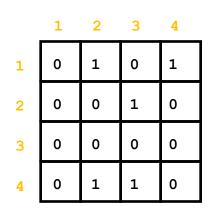

Representations of Graphs

Adjacency List

Adjacency Matrix

Adjacency Matrix or Adjacency List?

Definitions

- n = number of vertices
- m = number of edges
- d(u) = degree of u = number of edges leaving u

Adjacency Matrix

- Uses space O(n²)
- Can iterate over all edges in time O(n²)
- Can answer "Is there an edge from u to v?" in O(1) time
- Better for dense graphs (lots of edges)

Adjacency List

- Uses space O(m+n)
- Can iterate over all edges in time O(m+n)
- Can answer "Is there an edge from u to v?" in O(d(u)) time
- Better for sparse graphs (fewer edges)

Graph Algorithms

- Search
 - depth-first search
 - breadth-first search
- Shortest paths
 - Dijkstra's algorithm
- Minimum spanning trees
 - Prim's algorithm
 - Kruskal's algorithm
